

PowerLender® Loan Origination & Processing System

PowerLender Versatility

PowerLender is a highly customizable loan origination and processing system constructed in Java, the most popular and contemporary application development and deployment technology. PowerLender can be customized and modified by non-programmers to meet the specific needs of mortgage and consumer lenders. PowerLender allows you to do business the way you want, when you want. You can add loan plans, forms, screens, reports, lending rules/fields, tables, queries, workflow management, third-party interfaces, remote document delivery recipients, eligibility & pricing, auditing & security, document preparation and more. PowerLender contains all the tools you need to react to your ever-changing lending needs.

PowerLender was designed with “technical modularity,” meaning PowerLender **software programs**, **business rules** and **borrower data** are all separate. PowerLender program enhancements will not alter your business logic. We need only to maintain a single set of programs for essentially all PowerLender users, which reduces our ongoing enhancement costs in terms of time and money. This translates to lower costs for you in terms of operation and support.

We have been helping lenders grow for more than 25 years by providing quality software and outstanding, 24/7 technical support. If you'd like to know more about PowerLender, please call us at 800-628-4687 or visit us online at www.powerlender.com.
